

Basic HTML Document Outline:

```
<html>
  <head>
    <title>HTML Doc</title>
  </head>
  <body>
    <div>
      <h1>HTML Document</h1>
      <p>This is an HTML document!</p>
    </div>
  </body>
</html>
```

HTML Document Outline

<html>	HTML document.
<head>	Document header information.
<body>	Document body.

Page Information

<meta>	Metadata about the document. Will not be visible, but is machine parsable.
<title>	Define the title of the document, and is required.
<link>	Define a link between the HTML and an external resource, usually a stylesheet.
<style>	Define style information.
<script>	Define a client-side script.

Document Structure

	Hyperlink to another location.
<h1>,<h2>,<h3>,<h4>,<h5>,<h6>	Set text as heading, determine size.
<div>	Define a division or section of an HTML document, used to group block-elements for formatting with CSS.
	Group inline elements, used to add a hook to text. No formatting by itself.
<p>	Define a paragraph.
 	Define a line break.
<hr>	Define a horizontal rule or thematic break.

Lists

	Define an ordered list, or a list that is ordered numerically or alphabetically.
	Define an unordered list.
	Define an item on an ordered or unordered list.
<dl>	Define a description list, used with <dt> and <dd>
<dt>	Define a description term, or the name of an item in a description list.
<dd>	Define a description of an item in a description list.

Forms

<code><form></code>	Create a form that receives user input.
<code><fieldset></code>	Group related form elements together.
<code><label></code>	Define the label for an <code><input></code> form element.
<code><input></code>	Define a field where a user can enter data.
<code><select></code>	Create a drop-down list in a form.
<code><optgroup></code>	Group related options in a drop-down list.
<code><option></code>	Define an option in a drop-down list.
<code><textarea></code>	Create a text input field within a form.
<code><button></code>	Create a clickable button.

Tables

<code><table></code>	Define an HTML table consisting of one or more <code><tr></code> , <code><th></code> , and <code><td></code> elements.
<code><caption></code>	A table caption.
<code><thead></code>	Define table header content. Must be used after <code><table></code> , <code><caption></code> , and <code><colgroup></code> but before <code><tbody></code> , <code><tfoot></code> , and <code><tr></code> .
<code><tbody></code>	Define the body of a table. Must be used after <code><table></code> , <code><caption></code> , <code><colgroup></code> , or <code><thead></code> elements.
<code><colgroup></code>	Group columns together for formatting.
<code><col></code>	Specify properties for individual columns within a <code><colgroup></code>

<code><tr></code>	Define a row in an HTML table.
<code><th></code>	Define a cell in a table row as a header element.
<code><td></code>	Define a cell in a table row as a data element.

Text Formatting

<code></code>	Define important text.
<code></code>	Define emphasized text.
<code><blockquote></code>	Define text quoted from another source.
<code><q></code>	Define a short quotation.
<code><abbr></code>	Define an abbreviation.
<code><address></code>	Define the contact information for the author of a document or article.
<code><pre></code>	Define pre-formatted, text that preserves spaces and line-breaks.
<code><dfn></code>	Set the defining instance of a term.
<code><code></code>	Define a piece of computer code.
<code><cite></code>	Define a citation of the title of a work.
<code><sub></code>	Define subscript text.
<code><sup></code>	Define superscript text.
<code><bdo></code>	Set bi-directional override, making text direction reverse.
